INDICES OF INDUSTRIAL PRODUCTION

October 1977 : Continued stagnation

Initial estimates by EUROSTAT suggest that the Community Index of Industrial Production before adjustment for seasonal factors will be 121 (1970 =100) in October.

In October the seasonally adjusted index will be about 116 suggesting a continuation of the stagnation which started in June.

This stagnation is reflected in the production of intermediate and investment goods ; consumer goods ,however, show a continuation of their slight upward trend.

Most countries show either no change or a slight decrease over the previous month, with the exception of Germany where the provisional October Index marks a significant increase over September's level.

YEAR 1977: A year of little growth

First estimates for the calendar year 1977 suggest that there has been little growth of production compared with 1976. A result of about 2% over 1976 is to be expected when the final figures are available in March 1978. This slow growth is the result of a poor performance by the intermediate goods sector (about 1%) offsetting the better results of the consumer and investment goods industries (slightly over 2%). The low growth is in evidence in most member states except Germany and Ireland where better results are to be expected, and the U.K which should be slightly above the community average.
